

Business Developer

Thank you for taking the time to meet with us. Before we discuss possible solutions, could you briefly explain how UrbanCart currently handles customer interactions and orders?

Client

UrbanCart is an online store. We sell electronics, accessories, home products and some lifestyle products.

Most of our customers come through our website, Instagram and WhatsApp.

Our biggest problem is customer support. We receive a lot of questions every day, especially about products, prices, availability, delivery and returns.

Our support team answers most of these manually.

Business Developer

What happens when a customer contacts you outside working hours?

Client

Usually nothing immediately. Our team works during normal business hours. If someone sends a message at night, they may have to wait until the next day.

We're losing potential customers because of that.

We would like something that can respond to customers 24/7.

Business Developer

What would you expect such a system to handle?

Client

For simple questions, it should answer automatically.

For example:

- "Is this product available?"
- "What is the price?"
- "Do you deliver to Lahore?"

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

- "How long does delivery take?"
- "Can I return this product?"
- "Does this product have a warranty?"

But we don't want the AI making up information. Product information and company policies change, so it should use our actual information.

Business Developer

Would you prefer customers to interact through chat, phone, or both?

Client

Both.

We receive a lot of WhatsApp and website inquiries, but some customers prefer calling.

For phone calls, we'd like an AI receptionist that can understand what the customer wants and answer basic questions.

If somebody is interested in purchasing a product, it should also be able to collect their information and pass the lead to our sales team.

Business Developer

What information would you like to collect from potential customers?

Client

At minimum:

- Name
- Phone number
- Product they're interested in
- Their approximate budget
- Location
- Whether they're ready to purchase or just asking questions

Our sales team currently receives these leads through different places, so it's difficult to track them.

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

Business Developer

What happens after a lead is collected?

Client

Our sales team should be notified.

We currently use Slack internally.

It would be useful if the team could receive something like:

New customer interested in iPhone 15, budget Rs. 200,000, located in Lahore.

They should also be able to see the customer's previous information instead of starting from zero.

Business Developer

How do you currently manage customers and orders?

Client

We have data in different places.

Some customer information is in spreadsheets, some is in our e-commerce system, and our support team maintains another sheet for complaints.

We don't have one proper internal system.

We want customer information, leads, orders and support issues to be organized properly.

Business Developer

What happens when someone asks about an existing order?

Client

Our support team normally searches for the order manually.

For example, a customer might call and say:

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

"My order UC-10452 hasn't arrived yet."

The support agent has to find the order and then tell them the status.

It would be great if the AI could handle simple order-status questions as well.

Business Developer

What about complaints or complicated requests?

Client

The AI should not try to solve everything.

If someone says their product arrived damaged, wants a complicated refund, or becomes angry, the conversation should be passed to a human.

Our support team should know immediately that there's a high-priority issue.

Business Developer

You mentioned earlier that your policies and product information change frequently. How is that information maintained?

Client

We have documents for this.

We have a product catalog, return policy, shipping policy, warranty information and customer support guidelines.

We also have some internal training documents.

We can provide all of them.

Some are PDFs, some are Word documents and some information is maintained in spreadsheets.

Business Developer

Would you want the AI to use those documents when answering customers?

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

Client

Absolutely.

For example, if someone asks:

"Can I return headphones after 10 days?"

The AI should look at our actual return policy before answering.

The same applies to product specifications and warranty information.

If the information isn't available, the AI should tell the customer that it needs human assistance rather than guessing.

Business Developer

What happens when you receive new documents or update an existing policy?

Client

That is another problem.

Currently, someone has to manually update everything.

Ideally, if we upload a new product catalog or policy document, the AI's knowledge should eventually update automatically.

We don't want developers changing the system every time we update a PDF.

Business Developer

How would you like your internal team to manage all of this information?

Client

We want something simple.

Management should be able to see the important client/customer information.

Our operations team should be able to see tasks and issues.

The sales team needs leads.

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

The support team needs customer complaints and order information.

We also use Notion for internal documentation, so having project or knowledge information there would be useful.

Business Developer

Do you have any requirements regarding notifications?

Client

Yes.

We don't want Slack to become noisy.

Only important things should generate notifications.

For example:

- High-value lead
- Serious customer complaint
- Failed automation
- Important order issue

Normal customer questions don't need to notify the entire team.

Business Developer

What would success look like for you after implementing this system?

Client

Ideally, customers should be able to contact us through chat or phone at any time.

The AI should answer common questions using our actual business information.

It should identify potential buyers and send useful leads to sales.

It should handle basic order inquiries.

Our team should be alerted when human intervention is required.

And management should have a clear view of what's happening.

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

We don't necessarily need to automate everything on day one. We want something reliable that we can expand later.

Business Developer

Do you have any specific technology preferences?

Client

Not really.

We are not technical enough to decide the architecture.

We care about:

- Reliability
- Security
- Easy maintenance
- Reasonable cost
- Ability to scale
- Accurate AI responses

You can recommend the technology.

Business Developer

What is your expected timeline?

Client

We would like an initial working version within approximately 6–8 weeks.

We are open to starting with the most important functionality and expanding later.

Business Developer

Great. We'll analyze the requirements and come back with a proposed solution, architecture, implementation plan and estimated scope.

Client

Sounds good.

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!
